

WealthView

- Read-only Stellar treasury visibility
- Live MVP: wallet aggregation, share links, snapshots, JSON export
- No wallet connection | No custody | API-first
- wealthview.pro - [@wealthviewpro](https://twitter.com/wealthviewpro)

One-liner

- WealthView turns one or more Stellar public wallets into a shareable, read-only treasury view.
- Live today: wallet input, aggregation, share links, snapshots, JSON export, APIs.
- Early: rule-based Treasury Signals and Intelligence on top of aggregation.

Problem

- Stellar wallet data is public, but treasury workflows are still fragmented.
- Teams may split funds across reserve, operations, grant, and ecosystem wallets.
- Explorers show addresses; teams need reusable treasury-level reporting.

Product

- Input public Stellar wallets.
- Aggregate balances into one treasury view.
- Explain basic exposure through rule-based signals.
- Share or export via URL state, snapshot, JSON, and APIs.

Demo Flow

- Paste comma-separated Stellar public addresses.
- Analyze treasury and aggregate balances by asset.
- Review wallet count, total XLM, USD where priced, asset table, and warnings.
- Generate share link, snapshot, JSON export, or API response.

Built Today

- Multi-wallet Stellar aggregation.
- Shareable treasury state.
- Snapshot-based history and JSON export.
- Treasury Signals / Intelligence sections.
- OpenAPI, agent manifest, MCP manifest and endpoint docs.

Users

- Stellar teams managing reserve, operations, grants, or ecosystem wallets.
- Stablecoin and RWA projects monitoring public treasury exposure.
- AI agents and developer tools needing structured treasury data.

Engineering Sprint

- Built read-only workflows first to avoid private-key and custody risk.
- Prioritized data portability: share links, snapshots, exports, APIs.
- Kept MVP small enough to ship and test with real Stellar builders.

Validation Status

- Live public MVP at wealthview.pro.
- Pre-revenue; no user, revenue, or partnership numbers claimed.
- Needs proof: repeat usage, pricing reliability, real reporting workflows, willingness to pay.

Competition

- Explorers: great for addresses, weaker for multi-wallet treasury reporting.
- Wallets: best for holding and signing, not read-only reporting.
- Spreadsheets/scripts: flexible but manual and not agent-readable.
- WealthView wedge: Stellar-specific, shareable, exportable, API-friendly treasury view.

Business Model

- Current: free, no-login MVP to remove friction.
- Future paid wedges: team reporting workspaces, higher API limits, private support.
- Must first prove repeat usage, trusted coverage, and pilot workflows.

Why Now

- Stellar asset issuance, stablecoins, and tokenized assets create more reporting needs.
- Soroban expands the future data surface through contract-based assets.
- Agent workflows need structured APIs, not just human-facing dashboards.

Roadmap

- 0-2 months: harden aggregation, validation, warnings, mobile layout.
- 2-4 months: improve signals, pricing coverage, snapshot comparison.
- 4-6 months: recruit 3-5 Stellar pilot teams and refine APIs around real use cases.

Ask and Next Steps

- Seeking accelerator/grant support, technical feedback, and pilot users.
- Next: demo with real public wallets, collect feedback calls, publish API examples.
- North star: simplest read-only treasury state layer for Stellar teams and agents.
